

Reports may vary

Part 1:

$$H_0: \mu_d = 0$$

$$H_a: \mu_d > 0$$

$$\mu_d = \mu_A - \mu_B$$

$$\bar{x} = 8.6$$

$$s_d = 12.487$$

$$n = 20$$

$$t = 3.0799$$

$$p = 0.3\%$$

$$p < \alpha$$

Reject  $H_0$ , Accept  $H_a$

We have evidence that the SAT class is effective, on average, for all students.

Part 2:

$$H_0: \mu = 30$$

$$H_a: \mu < 30$$

$$\bar{x} = 28.8$$

$$s = 2.872$$

$$n = 25$$

$$t = -2.089$$

$$p = 2.37\%$$

$$p < \alpha$$

Reject  $H_0$ , Accept  $H_a$

We have evidence that the average class size of all 6th grade classes in California is less than 30 students.

Part 3:

$$H_0: \mu_r = \mu_s$$

$$H_a: \mu_r \neq \mu_s$$

$$\bar{x}_1 = 57429.9$$

$$s_1 = 3392.10$$

$$n_1 = 10$$

$$\bar{x}_2 = 60796.8$$

$$s_2 = 5557.94$$

$$n_2 = 10$$

$$t = -1.635$$

Using GC, we find  $p = 12.29\%$ . Using  $df = 9$ , we find  $10\% < p < 20\%$

$p > \alpha$ , Fail to reject  $H_0$ , Fail to accept  $H_a$

We do not have evidence that there is a difference, on average, between all rural salaries and all suburban salaries.

Using GC, we get this CI and sentence:

We are 90% confident that the average difference between all rural and suburban salaries is between  $-\$6978$ , which means suburban is higher by  $\$6978$ , and  $+\$245$ , which means rural is higher by  $\$245$ . Notice that zero is contained in the interval, so there may be no difference between the two groups.

Using  $df = 9$  and  $t = 1.883$ , we get this CI and sentence:

We are 90% confident that the average difference between all rural and suburban salaries is between  $-\$7141$ , which means suburban is higher by  $\$7141$ , and  $+\$407$ , which means rural is higher by  $\$407$ . Notice that zero is contained in the interval, so there may be no difference between the two groups.
